Summing a Variable Out of a Factor

- Let $f(X, \underline{Y})$ be a factor with variable X (\underline{Y} is a set)
- •We **sum out** variable X from f to produce a new factor h = Σ_x f, which is defined:

$$h(\underline{\mathbf{Y}}) = \sum_{x \in Dom(X)} f(x,\underline{\mathbf{Y}})$$

f(A,B)		h(B)	
ab	0.9	b	1.3
a~b	0.1	~b	0.7
~ab	0.4		
~a~b	0.6		

No error in the table. Here f(A,B) is not P(AB), but P(B|A).
